ABSTRACT OF THE DISCLOSURE

relates invention to new The present essential downstream component of the Wnt/Wingless (Wnt/Wq) signaling pathway and therapeutic applications based thereon. The diagnostic invention relates to nucleotide sequences of the Drosophila melanogaster legless (lgs) gene, encoded proteins, as well as derivatives (e.g., fragments) and analogues thereof. The invention includes vertebrate and invertebrate further homologues of the Lgs protein, comprising proteins that contain a contiguous stretch of amino acids with similarity to the Drosophila lgs gene. The invention further relates to the function of the Drosophila and the human Lqs proteins. Methods for producing the Lqs proteins, derivatives and analogs, e.g., by recombinant means and antibodies to Lgs are provided by the present invention. In addition, the invention also relates to the therapeutic and diagnostic methods and compositions based on Lgs proteins and nucleic acids or fragments thereof.
